

Unique Tixeo encryption architecture

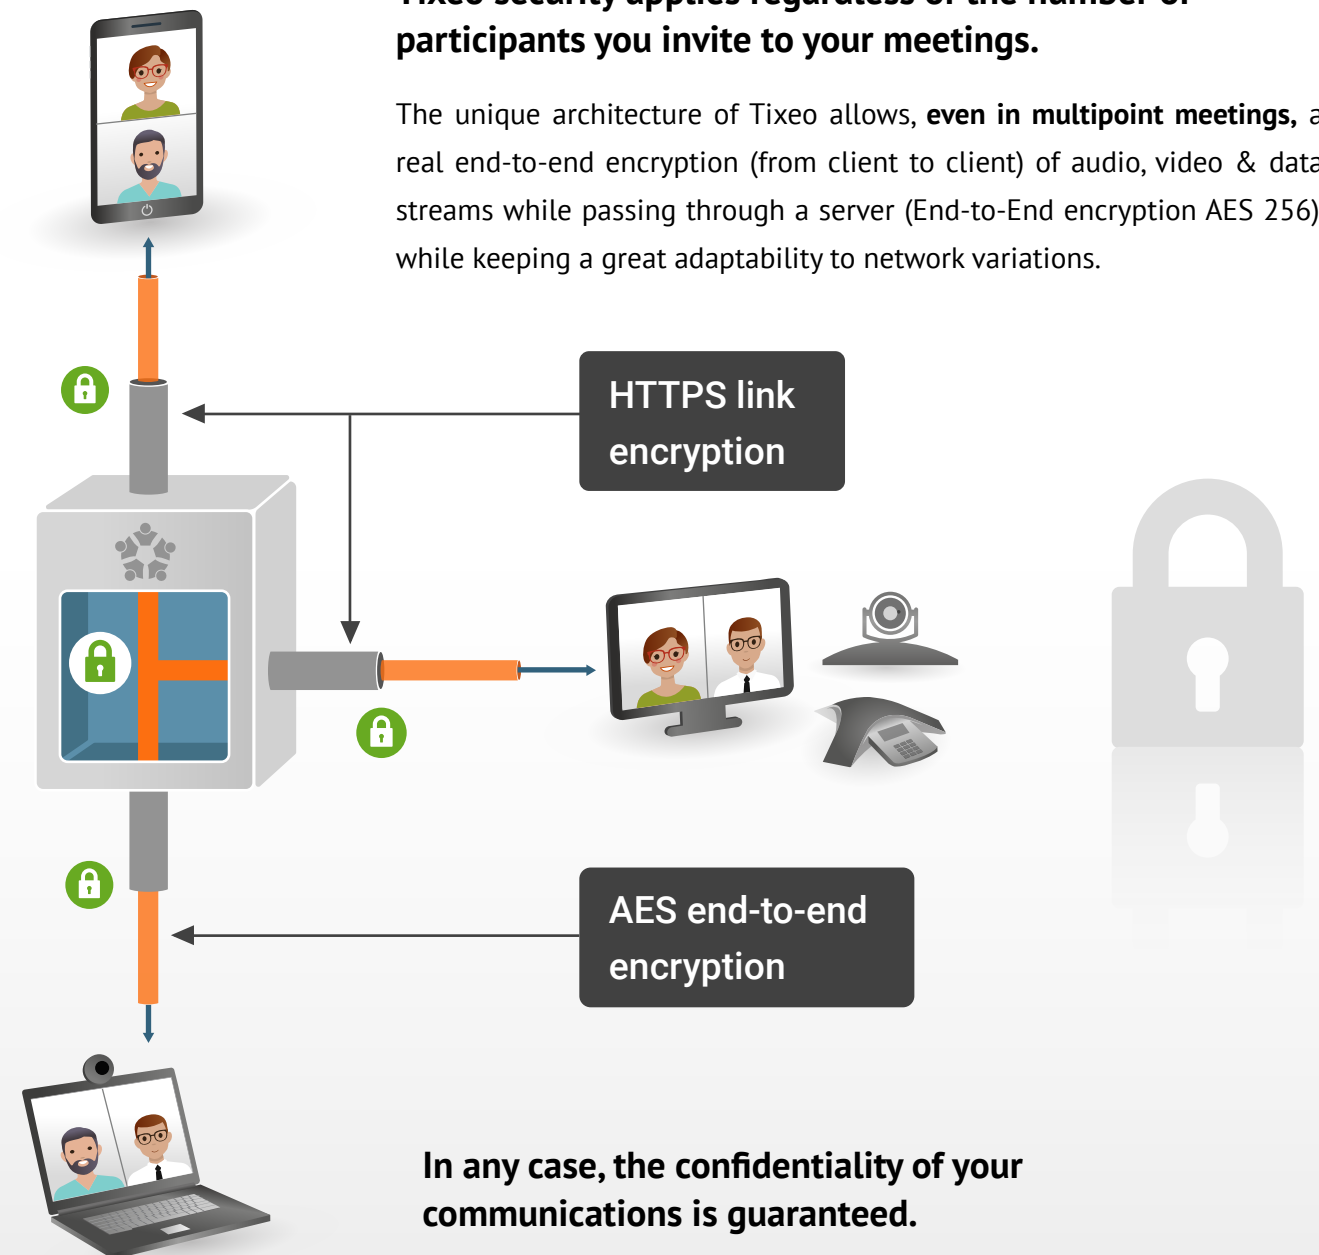

Encryption in legacy video conferencing

Encryption in Tixeo video conferencing

Tixeo security applies regardless of the number of participants you invite to your meetings.

The unique architecture of Tixeo allows, **even in multipoint meetings**, a real end-to-end encryption (from client to client) of audio, video & data streams while passing through a server (End-to-End encryption AES 256), while keeping a great adaptability to network variations.

In any case, the confidentiality of your communications is guaranteed.
